Recap

- 1 Recap
- 2 Encrypted Verification
- 3 Make It Sound
- 4 Make it Zero-Knowledge
- 5 Real Protocols

Recap

Each constraint in the Rank-1 Constraint System must be in the form:

$$\langle a, w \rangle \times \langle b, w \rangle = \langle c, w \rangle$$

Make it Zero-Knowledge

Recap. R1CS

Each constraint in the Rank-1 Constraint System must be in the form:

$$\langle \boldsymbol{a}, \boldsymbol{w} \rangle \times \langle \boldsymbol{b}, \boldsymbol{w} \rangle = \langle \boldsymbol{c}, \boldsymbol{w} \rangle$$

Where $\langle \boldsymbol{u}, \boldsymbol{v} \rangle$ is a dot product.

Encrypted Verification

$$\langle \boldsymbol{u}, \boldsymbol{v} \rangle := \boldsymbol{u}^{\top} \boldsymbol{v} = \sum_{i=1}^{n} u_{i} v_{i}$$

Each constraint in the Rank-1 Constraint System must be in the form:

$$\langle a, w \rangle \times \langle b, w \rangle = \langle c, w \rangle$$

Where $\langle \boldsymbol{u}, \boldsymbol{v} \rangle$ is a dot product.

Encrypted Verification

$$\langle \boldsymbol{u}, \boldsymbol{v} \rangle := \boldsymbol{u}^{\top} \boldsymbol{v} = \sum_{i=1}^{n} u_i v_i$$

Thus

$$\left(\sum_{i=1}^n a_i w_i\right) \times \left(\sum_{j=1}^n b_j w_j\right) = \sum_{k=1}^n c_k w_k$$

That is, actually, a quadratic equation with multiple variables.

Consider the simplest program:

```
def example(a: F, b: F, c: F) -> F:
    if a:
        return b * c
    else:
        return b + c
```

Make it Zero-Knowledge

Recap

Encrypted Verification

$$r = x_1 \times (x_2 \times x_3) + (1 - x_1) \times (x_2 + x_3)$$

Recap

000000000

$$r = x_1 \times (x_2 \times x_3) + (1 - x_1) \times (x_2 + x_3)$$

Thus, the next constraints can be build:

$$x_1 \times x_1 = x_1$$
 (binary check) (1)

$$x_2 \times x_3 = \mathsf{mult} \tag{2}$$

$$x_1 \times \text{mult} = \text{selectMult}$$
 (3)

$$(1-x_1)\times(x_2+x_3)=r-\mathsf{selectMult} \tag{4}$$

$$r = x_1 \times (x_2 \times x_3) + (1 - x_1) \times (x_2 + x_3)$$

Thus, the next constraints can be build:

$$x_1 \times x_1 = x_1$$
 (binary check) (1)

$$x_2 \times x_3 = \text{mult} \tag{2}$$

$$x_1 \times \text{mult} = \text{selectMult}$$
 (3)

$$(1 - x_1) \times (x_2 + x_3) = r - \text{selectMult}$$
 (4)

The witness vector: $\mathbf{w} = (1, r, x_1, x_2, x_3, \text{mult}, \text{selectMult}).$

$$r = x_1 \times (x_2 \times x_3) + (1 - x_1) \times (x_2 + x_3)$$

Thus, the next constraints can be build:

Encrypted Verification

$$x_1 \times x_1 = x_1$$
 (binary check) (1)

Make it Zero-Knowledge

$$x_2 \times x_3 = \mathsf{mult} \tag{2}$$

$$x_1 \times \text{mult} = \text{selectMult}$$
 (3)

$$(1-x_1)\times(x_2+x_3)=r-\mathsf{selectMult} \tag{4}$$

The witness vector: $\mathbf{w} = (1, r, x_1, x_2, x_3, \text{mult}, \text{selectMult}).$

The coefficients vectors:

$$a_1 = (0,0,1,0,0,0,0), \quad b_1 = (0,0,1,0,0,0,0), \quad c_1 = (0,0,1,0,0,0,0)$$

$$\mathbf{a}_2 = (0,0,0,1,0,0,0), \quad \mathbf{b}_2 = (0,0,0,0,1,0,0), \quad \mathbf{c}_2 = (0,0,0,0,0,1,0)$$

$$\textbf{\textit{a}}_3 = (0,0,1,0,0,0,0), \qquad \textbf{\textit{b}}_3 = (0,0,0,0,0,1,0), \quad \textbf{\textit{c}}_3 = (0,0,0,0,0,0,1)$$

$$\boldsymbol{a}_4 = (1, 0, -1, 0, 0, 0, 0), \quad \boldsymbol{b}_4 = (0, 0, 0, 1, 1, 0, 0), \quad \boldsymbol{c}_4 = (0, 1, 0, 0, 0, 0, -1)$$

Make it Zero-Knowledge

Recap. QAP

Encrypted Verification

R1CS provides us with the following constraint vectors:

$$a_1, a_2, \ldots, a_m, b_1, b_2, \ldots, b_m, c_1, c_2, \ldots, c_m,$$

Make it Zero-Knowledge

Recap. QAP

R1CS provides us with the following constraint vectors:

$$a_1, a_2, \ldots, a_m, b_1, b_2, \ldots, b_m, c_1, c_2, \ldots, c_m,$$

Of course, they form corresponding matrices:

$$A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix}, \text{ same goes for } B \text{ and } C$$

Recap. QAP

Encrypted Verification

R1CS provides us with the following constraint vectors:

$$a_1, a_2, \ldots, a_m, b_1, b_2, \ldots, b_m, c_1, c_2, \ldots, c_m,$$

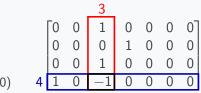

Of course, they form corresponding matrices:

$$A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix}, \text{ same goes for } B \text{ and } C$$

An example of a single "if" statement:

$$\mathbf{a}_1 = (0,0,1,0,0,0,0)$$

 $\mathbf{a}_2 = (0,0,0,1,0,0,0)$
 $\mathbf{a}_3 = (0,0,1,0,0,0,0)$
 $\mathbf{a}_4 = (1,0,-1,0,0,0,0)$

Make it Zero-Knowledge

Recap. QAP

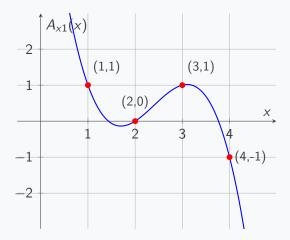

Illustration: The Lagrange inteprolation polynomial for points $\{(1,1),(2,0),(3,1),(4,-1)\}$ visualized over \mathbb{R} .

Recap

000000000

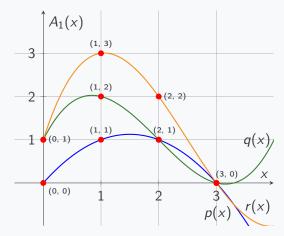

Figure: Addition of two polynomials

Make it Zero-Knowledge

Now, using coefficients encoded with polynomials, we can build a constraint number $x \in \{1, ..., m\}$ in the next way:

$$(w_1A_1(x) + w_2A_2(x) + \dots + w_nA_n(x)) \times \times (w_1B_1(x) + w_2B_2(x) + \dots + w_nB_n(x)) = = (w_1C_1(x) + w_2C_2(x) + \dots + w_nC_n(x))$$

Now, using coefficients encoded with polynomials, we can build a constraint number $x \in \{1, ..., m\}$ in the next way:

$$(w_1A_1(x) + w_2A_2(x) + \dots + w_nA_n(x)) \times \times (w_1B_1(x) + w_2B_2(x) + \dots + w_nB_n(x)) = = (w_1C_1(x) + w_2C_2(x) + \dots + w_nC_n(x))$$

Or written more concisely:

$$\left(\sum_{i=1}^n w_i A_i(x)\right) \times \left(\sum_{i=1}^n w_i B_i(x)\right) = \left(\sum_{i=1}^n w_i C_i(x)\right)$$

$$A(x) \times B(x) = C(x)$$

Make it Zero-Knowledge

Recap. QAP

Encrypted Verification

Now, we can define a **master polynomial** M(x), that has zeros at all elements from the set $\Omega = \{1, \dots, m\}$

$$M(x) = A(x) \times B(x) - C(x)$$

Recap. QAP

Now, we can define a **master polynomial** M(x), that has zeros at all elements from the set $\Omega = \{1, \dots, m\}$

$$M(x) = A(x) \times B(x) - C(x)$$

It means, that M(x) can be divided by vanishing polynomial $Z_{\Omega}(x)$ without a remainder!

$$Z_{\Omega}(x) = \prod_{i=1}^{m} (x-i), \qquad H(x) = \frac{M(x)}{Z_{\Omega}(x)}$$
 is a polynomial

Recap

Encrypted Verification

Current Point

Recap

We've managed to encode into a single polynomial an entire computation (a program), of any size, independent of how much data it consumes.

Current Point

We've managed to encode into a single polynomial an entire computation (a program), of any size, independent of how much data it consumes.

Now, we need to figure our the protocol, how a prover can succinctly proof the knowledge of a correct witness for some circuit to a verifier, additionally, make it zero-knowledge and non-interactive.

Recap

We've managed to encode into a single polynomial an entire computation (a program), of any size, independent of how much data it consumes.

Now, we need to figure our the protocol, how a prover can succinctly proof the knowledge of a correct witness for some circuit to a verifier, additionally, make it zero-knowledge and non-interactive.

Where the knowledge of the correct witness is a knowledge of the quotient polynomial H(x).

$$M(x) = H(x) \times Z_{\Omega}(x)$$

Remark

Further, for brevity, we will denote $Z_{\Omega}(x)$ as Z(x).

Recap

In this section, we will use:

✓ Group of points on elliptic curve denoted as \mathbb{G} of prime order q with a generator g.

Notation Preliminaries: Groups

In this section, we will use:

- ✓ Group of points on elliptic curve denoted as \mathbb{G} of prime order q with a generator g.
- ✓ The symmetric pairing function $e : \mathbb{G} \times \mathbb{G} \to \mathbb{G}_T$, where (\mathbb{G}_T, \times) is a target group (typically, just a scalar from extension \mathbb{F}_{p^k}).

Recall

The core property of the pairing function *e* is the **bilinearity**:

$$e(g^{\alpha},g^{\beta})=e(g^{\alpha\beta},g)=e(g,g^{\alpha\beta})=e(g,g)^{\alpha\beta}.$$

Here, g^{α} is the same as "scalar multiplication of a generator by a scalar $\alpha \in \mathbb{Z}_q$ ".

Notation Preliminaries: QAP

Recall that the core equation to be proven:

$$\left(\sum_{i=1}^n w_i A_i(x)\right) \times \left(\sum_{i=1}^n w_i B_i(x)\right) - \left(\sum_{i=1}^n w_i C_i(x)\right) = Z(x) H(x)$$

Make It Sound

Here, we will change notation a bit: instead of A and B, we are going to use L and R, while C becomes O.

So equation becomes:

$$\underbrace{\left(\sum_{i=1}^{n} w_{i} L_{i}(x)\right)}_{\text{left wires encoding}} \times \underbrace{\left(\sum_{i=1}^{n} w_{i} R_{i}(x)\right)}_{\text{right wires encoding}} - \underbrace{\left(\sum_{i=1}^{n} w_{i} O_{i}(x)\right)}_{\text{output encodings}} = Z(x)H(x)$$

Recap

Naive Proof

Suppose, we are given a circuit \mathcal{C} with a maximum degree d of polynomials used underneath.

Thus, all parties additionally know the target polynomial Z(x) and QAP polynomials $\{L_i(x)\}_{i\in[n]}, \{R_i(x)\}_{i\in[n]}, \{O_i(x)\}_{i\in[n]}, \text{ where } n \text{ is } n \in [n]$ number of witness elements.

Suppose, we are given a circuit $\mathcal C$ with a maximum degree d of polynomials used underneath.

Thus, all parties additionally know the target polynomial Z(x) and QAP polynomials $\{L_i(x)\}_{i\in[n]}, \{R_i(x)\}_{i\in[n]}, \{O_i(x)\}_{i\in[n]}, \text{ where } n \text{ is number of witness elements.}$

Prover

✓ Provides witness w to a Verifier.

Prover

✓ Provides witness w to a Verifier.

Verifier

✓ Checks $(\sum_{i=1}^n w_i L_i(x)) \times (\sum_{i=1}^n w_i R_i(x)) = (\sum_{i=1}^n w_i O_i(x))$

- **X** Succint
- ✓ Non-Interactive
- X Zero-Knowledge

- X Succint
- ✓ Non-Interactive
- X Zero-Knowledge

The verifier could actually just run a program that represents a circuit C on witness data w.

- **X** Succint
- ✓ Non-Interactive
- X Zero-Knowledge

The verifier could actually just run a program that represents a circuit C on witness data w.

We, definitely, need to encrypt the witness data w somehow...

Recap

Let's define the *encryption* operation as follows:

$$\operatorname{Enc}: \mathbb{Z}_q \to \mathbb{G}, \quad \operatorname{Enc}(x) := g^x$$

Let's define the *encryption* operation as follows:

$$Enc: \mathbb{Z}_q \to \mathbb{G}, \quad Enc(x) := g^x$$

Essentially, $Enc(p(\tau))$ is the **KZG Commitment** com(p).

Example

Consider the polynomial: $p(x) = x^2 - 5x + 2$, the encryption of $p(\tau)$ can be found as follows:

$$\mathsf{Enc}(p(\tau)) = g^{p(\tau)} = g^{\left(\tau^2 - 5\tau + 2\right)} = \left(g^{\tau^2}\right)^1 \cdot \left(g^{\tau^1}\right)^{-5} \cdot \left(g^{\tau^0}\right)^2$$

Let's define the *encryption* operation as follows:

$$Enc: \mathbb{Z}_q \to \mathbb{G}, \quad Enc(x) := g^x$$

Essentially, $Enc(p(\tau))$ is the **KZG Commitment** com(p).

Example

Consider the polynomial: $p(x) = x^2 - 5x + 2$, the encryption of $p(\tau)$ can be found as follows:

$$\mathsf{Enc}(p(\tau)) = g^{p(\tau)} = g^{(\tau^2 - 5\tau + 2)} = \left(g^{\tau^2}\right)^1 \cdot \left(g^{\tau^1}\right)^{-5} \cdot \left(g^{\tau^0}\right)^2$$

Question

KZG Commitment requires encrypted powers of τ : $\{g^{\tau^i}\}_{i\in[d]}$. But where the prover can take them?

Trusted Party Setup

✓ Picks a random value $\tau \stackrel{R}{\leftarrow} \mathbb{F}$.

- ✓ Picks a random value $\tau \stackrel{R}{\leftarrow} \mathbb{F}$.
- ✓ Calculates the public parameters $\{g^{\tau^i}\}_{i \in [d]}$.

- ✓ Picks a random value $\tau \stackrel{R}{\leftarrow} \mathbb{F}$.
- ✓ Calculates the public parameters $\{g^{\tau^i}\}_{i \in [d]}$.
- ✓ **Deletes** τ (toxic waste).

- ✓ Picks a random value $\tau \stackrel{R}{\leftarrow} \mathbb{F}$.
- ✓ Calculates the public parameters $\{g^{\tau^i}\}_{i \in [d]}$.
- ✓ **Deletes** τ (toxic waste).
- ✓ Outputs prover parameters pp $\leftarrow \{g^{\tau^i}\}_{i \in [d]}$ and verifier parameters vp \leftarrow com(Z).

- ✓ Picks a random value $\tau \stackrel{R}{\leftarrow} \mathbb{F}$.
- ✓ Calculates the public parameters $\{g^{\tau^i}\}_{i \in [d]}$.
- ✓ **Deletes** τ (toxic waste).
- ✓ Outputs prover parameters pp $\leftarrow \{g^{\tau^i}\}_{i \in [d]}$ and verifier parameters vp \leftarrow com(Z).

Trusted Party Setup

- ✓ Picks a random value $\tau \stackrel{R}{\leftarrow} \mathbb{F}$.
- ✓ Calculates the public parameters $\{g^{\tau^i}\}_{i \in [d]}$.
- ✓ **Deletes** τ (toxic waste).
- ✓ Outputs prover parameters pp $\leftarrow \{g^{\tau'}\}_{i \in [d]}$ and verifier parameters vp \leftarrow com(Z).

This way, we can find the KZG commitment for each polynomial. For example:

$$\operatorname{com}(L) \triangleq g^{L(\tau)} = g^{\sum_{i=0}^{d} L_i \tau^i} = \prod_{i=0}^{d} (g^{\tau^i})^{L_i},$$

Now, we can calculate the following KZG commitments (or, synonymously, encryptions):

$$g^{L(\tau)}, g^{R(\tau)}, g^{O(\tau)}, g^{H(\tau)}, g^{Z(\tau)}$$

But how can we verify H(x)Z(x) = L(x)R(x) - O(x) in the encrypted space?

Well, first notice that, according to the **Schwarz-Zippel Lemma**, with overwhelming probability the check is equivalent to:

$$L(\tau)R(\tau) = Z(\tau)H(\tau) + O(\tau).$$

So, we can check this equality as follows:

$$e(com(L), com(R)) = e(com(Z), com(H)) \cdot e(com(O), g),$$

Trusted Setup: $\tau \overset{R}{\longleftarrow} \mathbb{F}$, $\{g^{\tau^i}\}_{i \in [d]}$, $g^{Z(\tau)}$, delete (τ) .

Trusted Setup: $\tau \overset{R}{\longleftarrow} \mathbb{F}$, $\{g^{\tau^i}\}_{i \in [d]}$, $g^{Z(\tau)}$, delete (τ) .

Problem

There is no guarantee that the same witness w was used to calculate all the commitments π_L , π_R , π_O , π_H .

Make It Sound

Recal that:

$$L(x) = \sum_{i=0}^{n} w_i L_i(x), \quad R(x) = \sum_{i=0}^{n} w_i R_i(x), \quad O(x) = \sum_{i=0}^{n} w_i O_i(x).$$

Recal that:

$$L(x) = \sum_{i=0}^{n} w_i L_i(x), \quad R(x) = \sum_{i=0}^{n} w_i R_i(x), \quad O(x) = \sum_{i=0}^{n} w_i O_i(x).$$

Here public data is:

$$\{L_i(x)\}_{i\in[n]}, \{R_i(x)\}_{i\in[n]}, \{O_i(x)\}_{i\in[n]}$$

Recal that:

$$L(x) = \sum_{i=0}^{n} w_i L_i(x), \quad R(x) = \sum_{i=0}^{n} w_i R_i(x), \quad O(x) = \sum_{i=0}^{n} w_i O_i(x).$$

Here public data is:

$$\{L_i(x)\}_{i\in[n]}, \{R_i(x)\}_{i\in[n]}, \{O_i(x)\}_{i\in[n]}$$

Moreover, it's defined only by the circuit and trusted setup, thus, it can calculated before proof generation as a part of the trusted setup.

Updated Trusted Setup:

$$\begin{split} & \{\boldsymbol{g}^{\tau^{i}}\}_{i \in [d]}, \quad \{\boldsymbol{g}^{\alpha \tau^{i}}\}_{i \in [d]}, \\ & \{\boldsymbol{g}^{L_{i}(\tau)}\}_{i \in [n]}, \quad \{\boldsymbol{g}^{\alpha L_{i}(\tau)}\}_{i \in [n]}, \\ & \{\boldsymbol{g}^{R_{i}(\tau)}\}_{i \in [n]}, \quad \{\boldsymbol{g}^{\alpha R_{i}(\tau)}\}_{i \in [n]}, \\ & \{\boldsymbol{g}^{O_{i}(\tau)}\}_{i \in [n]}, \quad \{\boldsymbol{g}^{\alpha O_{i}(\tau)}\}_{i \in [n]}, \end{split}$$

Updated Trusted Setup:

$$\begin{split} & \{\boldsymbol{g}^{\tau^{i}}\}_{i \in [d]}, \quad \{\boldsymbol{g}^{\alpha \tau^{i}}\}_{i \in [d]}, \\ & \{\boldsymbol{g}^{L_{i}(\tau)}\}_{i \in [n]}, \quad \{\boldsymbol{g}^{\alpha L_{i}(\tau)}\}_{i \in [n]}, \\ & \{\boldsymbol{g}^{R_{i}(\tau)}\}_{i \in [n]}, \quad \{\boldsymbol{g}^{\alpha R_{i}(\tau)}\}_{i \in [n]}, \\ & \{\boldsymbol{g}^{O_{i}(\tau)}\}_{i \in [n]}, \quad \{\boldsymbol{g}^{\alpha O_{i}(\tau)}\}_{i \in [n]}, \end{split}$$

Consider the polynomial $L(x) = \sum_{i=0}^{n} w_i L_i(x)$.

Additional Optimization

Updated Trusted Setup:

$$\begin{split} & \{g^{\tau^i}\}_{i \in [d]}, \quad \{g^{\alpha \tau^i}\}_{i \in [d]}, \\ & \{g^{L_i(\tau)}\}_{i \in [n]}, \quad \{g^{\alpha L_i(\tau)}\}_{i \in [n]}, \\ & \{g^{R_i(\tau)}\}_{i \in [n]}, \quad \{g^{\alpha R_i(\tau)}\}_{i \in [n]}, \\ & \{g^{O_i(\tau)}\}_{i \in [n]}, \quad \{g^{\alpha O_i(\tau)}\}_{i \in [n]}, \end{split}$$

Consider the polynomial $L(x) = \sum_{i=0}^{n} w_i L_i(x)$.

 ${\mathcal P}$ can compute the KZG commitment π_L and its PoE π_L' as follows:

$$\pi_L \triangleq g^{L(\tau)} = g^{\sum_{i=0}^n w_i L_i(\tau)} = \prod_{i=0}^n (g^{L_i(\tau)})^{w_i},$$

$$\pi'_L \triangleq g^{\alpha L(\tau)} = g^{\alpha \sum_{i=0}^n w_i L_i(\tau)} = \prod_{i=0}^n (g^{\alpha L_i(\tau)})^{w_i}.$$

Recap

Witness Consistency Check

To prove that the same w is used in all commitments, we need some "checksum" term that will somehow combine all polynomials L(x), R(x), and O(x) with the witness w.

Recap

To prove that the same w is used in all commitments, we need some "checksum" term that will somehow combine all polynomials L(x), R(x), and O(x) with the witness w.

We can do so by proving the next simple statement:

$$g^{L(\tau)+R(\tau)+O(\tau)} =$$

Witness Consistency Check

To prove that the same w is used in all commitments, we need some "checksum" term that will somehow combine all polynomials L(x), R(x), and O(x) with the witness w.

We can do so by proving the next simple statement:

$$g^{L(\tau)+R(\tau)+O(\tau)} = \prod_{i=1}^{n} \left(g^{L_{i}(\tau)+R_{i}(\tau)+O_{i}(\tau)} \right)^{w_{i}}$$

Witness Consistency Check

To prove that the same w is used in all commitments, we need some "checksum" term that will somehow combine all polynomials L(x), R(x), and O(x) with the witness w.

We can do so by proving the next simple statement:

$$g^{L(\tau)+R(\tau)+O(\tau)} = \prod_{i=1}^{n} \left(g^{L_{i}(\tau)+R_{i}(\tau)+O_{i}(\tau)} \right)^{w_{i}}$$

And we already know how to do that — POE!

Recap

Let's introduce one more coefficient...

$$\beta \stackrel{R}{\leftarrow} \mathbb{F}$$

Witness Consistency Check

Let's introduce one more coefficient...

$$\beta \stackrel{R}{\leftarrow} \mathbb{F}$$

Extended trusted setup contains additional values:

$$g^{\beta}, \quad \{g^{\beta(L_i(\tau)+R_i(\tau)+O_i(\tau))}\}_{i\in[n]}$$

Recap

Witness Consistency Check

Let's introduce one more coefficient...

$$\beta \xleftarrow{R} \mathbb{F}$$

Extended trusted setup contains additional values:

$$g^{\beta}$$
, $\{g^{\beta(L_i(\tau)+R_i(\tau)+O_i(\tau))}\}_{i\in[n]}$

Prover needs to calculate π_{β} :

$$\pi_{\beta} \leftarrow g^{\beta(L(\tau)+R(\tau)+O(\tau))} =$$

Witness Consistency Check

Let's introduce one more coefficient...

$$\beta \xleftarrow{R} \mathbb{F}$$

Extended trusted setup contains additional values:

$$g^{\beta}$$
, $\{g^{\beta(L_i(\tau)+R_i(\tau)+O_i(\tau))}\}_{i\in[n]}$

Prover needs to calculate π_{β} :

$$\pi_{\beta} \leftarrow g^{\beta(L(\tau)+R(\tau)+O(\tau))} = \prod_{i=1}^{n} g^{\beta(L_i(\tau)+R_i(\tau)+O_i(\tau))} g^{w_i}$$

Witness Consistency Check

Let's introduce one more coefficient...

$$\beta \xleftarrow{R} \mathbb{F}$$

Extended trusted setup contains additional values:

$$g^{\beta}, \quad \{g^{\beta(L_i(\tau)+R_i(\tau)+O_i(\tau))}\}_{i\in[n]}$$

Prover needs to calculate π_{β} :

$$\pi_{\beta} \leftarrow g^{\beta(L(\tau)+R(\tau)+O(\tau))} = \prod_{i=1}^{n} g^{\beta(L_i(\tau)+R_i(\tau)+O_i(\tau))} g^{w_i}$$

And easy check for verifier:

$$e(\pi_L\pi_R\pi_O,g^\beta)=e(\pi_\beta,g).$$

If the witness is consistent, the following condition must hold:

$$(w_{L,i}L_i(\tau)+w_{R,i}R_i(\tau)+w_{O,i}O_i(\tau))\beta=w_i\beta(L_i(\tau)+R_i(\tau)+O_i(\tau))\quad\forall i\in[n]$$

If the witness is consistent, the following condition must hold:

$$(w_{L,i}L_i(\tau)+w_{R,i}R_i(\tau)+w_{O,i}O_i(\tau))\beta=w_i\beta(L_i(\tau)+R_i(\tau)+O_i(\tau))\quad\forall i\in[n]$$

But, what if $L_i \equiv R_i$. Let's call them q, thus:

$$(w_{L,i} + w_{R,i})q + w_{O,i}O_i(\tau) = w_{\beta,i}(2q + O_i(\tau)) \quad \forall i \in [n]$$

If the witness is consistent, the following condition must hold:

$$(w_{L,i}L_i(\tau)+w_{R,i}R_i(\tau)+w_{O,i}O_i(\tau))\beta=w_i\beta(L_i(\tau)+R_i(\tau)+O_i(\tau))\quad\forall i\in[n]$$

But, what if $L_i \equiv R_i$. Let's call them q, thus:

$$(w_{L,i} + w_{R,i})q + w_{O,i}O_i(\tau) = w_{\beta,i}(2q + O_i(\tau)) \quad \forall i \in [n]$$

The adversary can choose $w_{L,i}$, $w_{R,i}$ and $w_{O,i}$ such that:

$$w_i := w_{O,i}$$
 and $w_{L,i} = 2w_{O,i} - w_{R,i}$

If the witness is consistent, the following condition must hold:

$$(w_{L,i}L_i(\tau)+w_{R,i}R_i(\tau)+w_{O,i}O_i(\tau))\beta=w_i\beta(L_i(\tau)+R_i(\tau)+O_i(\tau))\quad\forall i\in[n]$$

But, what if $L_i \equiv R_i$. Let's call them q, thus:

$$(w_{L,i} + w_{R,i})q + w_{O,i}O_i(\tau) = w_{\beta,i}(2q + O_i(\tau)) \quad \forall i \in [n]$$

The adversary can choose $w_{L,i}$, $w_{R,i}$ and $w_{O,i}$ such that:

$$w_i := w_{O,i}$$
 and $w_{L,i} = 2w_{O,i} - w_{R,i}$

Example

$$w = w_O = 5$$
, $w_L = 7$, $w_R = 3$
 $(7+3)q + 5O(\tau) = 5(2q + O(\tau))$
 $10q + 5O(\tau) = 10q + 5O(\tau)$

More coefficients!

Recap

The main problem is that if $R_i \equiv L_i$ then $\beta R_i \equiv \beta L_i$.

More coefficients!

The main problem is that if $R_i \equiv L_i$ then $\beta R_i \equiv \beta L_i$.

Let's fix that by introducing a separate β coefficients for L, R and O.

$$(\beta_L, \beta_R, \beta_O) \stackrel{R}{\leftarrow} \mathbb{F}^3$$

Recap

lore coefficients:

The main problem is that if $R_i \equiv L_i$ then $\beta R_i \equiv \beta L_i$.

Let's fix that by introducing a separate β coefficients for L, R and O.

$$(\beta_L, \beta_R, \beta_O) \stackrel{R}{\leftarrow} \mathbb{F}^3$$

Therefore, $\beta_R R_i \neq \beta_L L_i$ even if $R_i \equiv L_i$, so the previous hack doesn't work.

More coefficients!

The main problem is that if $R_i \equiv L_i$ then $\beta R_i \equiv \beta L_i$.

Let's fix that by introducing a separate β coefficients for L, R and O.

$$(\beta_L, \beta_R, \beta_O) \stackrel{R}{\leftarrow} \mathbb{F}^3$$

Therefore, $\beta_R R_i \neq \beta_L L_i$ even if $R_i \equiv L_i$, so the previous hack doesn't work.

So, finally, the trusted setup is updated with:

$$g^{\beta_L}, g^{\beta_R}, g^{\beta_O}, \{g^{(\beta_L L_i(\tau) + \beta_R R_i(\tau) + \beta_O O_i(\tau))}\}_{i \in [n]}$$

More coefficients!

The main problem is that if $R_i \equiv L_i$ then $\beta R_i \equiv \beta L_i$.

Let's fix that by introducing a separate β coefficients for L, R and O.

$$(\beta_L, \beta_R, \beta_O) \stackrel{R}{\leftarrow} \mathbb{F}^3$$

Therefore, $\beta_R R_i \neq \beta_L L_i$ even if $R_i \equiv L_i$, so the previous hack doesn't work.

So, finally, the trusted setup is updated with:

$$g^{\beta_L}, g^{\beta_R}, g^{\beta_O}, \{g^{(\beta_L L_i(\tau) + \beta_R R_i(\tau) + \beta_O O_i(\tau))}\}_{i \in [n]}$$

Verification:

$$e(\pi_L, g^{\beta_L}) \cdot e(\pi_R, g^{\beta_R}) \cdot e(\pi_O, g^{\beta_O}) = e(\pi_\beta, g)$$

As the adversary has an access to the public g^{β_L} , g^{β_R} , g^{β_O} he still can cheat verifier by calculating modified π_{β} .

Example

Recap

Consider a constraint $w_1 \times w_1 = w_2$. Let's try to assign 2 and 5 for w_1 in a single constraint. As $2 \times 5 = 10$, the w_2 should contains value 10.

$$w = (w_1, w_2) = (2, 10)$$

As the adversary has an access to the public g^{β_L} , g^{β_R} , g^{β_O} he still can cheat verifier by calculating modified π_{β} .

Example

Consider a constraint $w_1 \times w_1 = w_2$. Let's try to assign 2 and 5 for w_1 in a single constraint. As $2 \times 5 = 10$, the w_2 should contains value 10.

$$w = (w_1, w_2) = (2, 10)$$

The next QAP can be built:

$$L(x) = 2L_1(x) + 10L_2(x)$$

$$R(x) = 2R_1(x) + 3 + 10R_2(x)$$

$$O(x) = 2O_1(x) + 10O_2(x)$$

As the adversary has an access to the public g^{β_L} , g^{β_R} , g^{β_O} he still can cheat verifier by calculating modified π_{β} .

Example

Consider a constraint $w_1 \times w_1 = w_2$. Let's try to assign 2 and 5 for w_1 in a single constraint. As $2 \times 5 = 10$, the w_2 should contains value 10.

$$w = (w_1, w_2) = (2, 10)$$

The next QAP can be built:

$$L(x) = 2L_1(x) + 10L_2(x)$$

$$R(x) = 2R_1(x) + 3 + 10R_2(x)$$

$$O(x) = 2O_1(x) + 10O_2(x)$$

Compute π_{β} as:

$$(g^{(\beta_L L_1(\tau) + \beta_R R_1(\tau) + \beta_O O_1(\tau))})^2 \cdot (g^{\beta_R})^3 \cdot (g^{(\beta_L L_2(\tau) + \beta_R R_2(\tau) + \beta_O O_2(\tau))})^{10}$$

Recap

To prevent this, let's introduce... one more coefficient!

$$\gamma \stackrel{R}{\leftarrow} \mathbb{F}$$

To prevent this, let's introduce... one more coefficient!

$$\gamma \stackrel{R}{\leftarrow} \mathbb{F}$$

So, finally... the trusted setup is updated with:

$$g^{\gamma}, g^{\beta_L}, g^{\beta_R}, g^{\beta_O}, \{g^{(\beta_L L_i(\tau) + \beta_R R_i(\tau) + \beta_O O_i(\tau))}\}_{i \in [n]}$$

To prevent this, let's introduce... one more coefficient!

$$\gamma \xleftarrow{R} \mathbb{F}$$

So, finally... the trusted setup is updated with:

$$g^{\gamma}, g^{\beta_L}, g^{\beta_R}, g^{\beta_O}, \{g^{(\beta_L L_i(\tau) + \beta_R R_i(\tau) + \beta_O O_i(\tau))}\}_{i \in [n]}$$

Proving process isn't changed, unlike verification:

$$e(\pi_L, g^{\beta_L \gamma}) \cdot e(\pi_R, g^{\beta_R \gamma}) \cdot e(\pi_O, g^{\beta_O \gamma}) = e(\pi_\beta, g^\gamma)$$

That makes it unfeasible to cheat.

Trusted Setup:

Recap

Why we need modifications?

Question

According to the security assumptions, given any element of our proof π , it is impossible to restore the witness w.

Question

- \blacktriangleright According to the security assumptions, given any element of our proof π , it is impossible to restore the witness \mathbf{w} .
- ➤ Well, that is true, but does it guarantee that no other information about w is not leaked?

Question

- \blacktriangleright According to the security assumptions, given any element of our proof π , it is impossible to restore the witness \mathbf{w} .
- ➤ Well, that is true, but does it guarantee that no other information about w is not leaked?

It does not! For example, given π , I can check if L(x) = 10R(x).

Question

- ➤ According to the security assumptions, given any element of our proof π , it is impossible to restore the witness \mathbf{w} .
- ➤ Well, that is true, but does it guarantee that no other information about w is not leaked?

It does not! For example, given π , I can check if L(x) = 10R(x).

$$\pi_L \stackrel{?}{=} \pi_R^{10}$$
.

Question

- \blacktriangleright According to the security assumptions, given any element of our proof π , it is impossible to restore the witness w.
- ➤ Well, that is true, but does it guarantee that no other information about w is not leaked?

It does not! For example, given π , I can check if L(x) = 10R(x). How? Simply check

$$\pi_L \stackrel{?}{=} \pi_R^{10}$$
.

This works since $\pi_L = g^{L(\tau)}$ and $\pi_R = g^{R(\tau)}$, so

$$\pi_L = \pi_R^{10} \Leftrightarrow g^{L(\tau)} = g^{10R(\tau)} \Leftrightarrow L(\tau) = 10R(\tau) \Leftrightarrow L(x) = 10R(x)$$

Analysis

➤ Currently, proof consists of four ingredients: $\pi_L, \pi_R, \pi_O, \pi_H$, and their corresponding PoEs.

Analysis

- ➤ Currently, proof consists of four ingredients: $\pi_L, \pi_R, \pi_O, \pi_H$, and their corresponding PoEs.
- ▶ But, current construction creates some "connection" between these ingredients. For example, $\pi_L^{101} = \pi_R$ reveals whether 101L(x) = R(x) or $\pi_L \pi_O = \pi_R$ whether L(x) + O(x) = R(x).

Analysis

- ► Currently, proof consists of four ingredients: $\pi_L, \pi_R, \pi_O, \pi_H$, and their corresponding PoEs.
- ▶ But, current construction creates some "connection" between these ingredients. For example, $\pi_L^{101} = \pi_R$ reveals whether 101L(x) = R(x) or $\pi_L \pi_O = \pi_R$ whether L(x) + O(x) = R(x).
- ➤ Therefore, the prover must add some "noise" to the proof, so that the verifier can't use the proof to extract any information about the witness. The randomness of prover is kept secret.

Encrypted Verification

Analysis

- \triangleright Currently, proof consists of four ingredients: $\pi_L, \pi_R, \pi_O, \pi_H$, and their corresponding PoEs.
- ➤ But, current construction creates some "connection" between these ingredients. For example, $\pi_I^{101} = \pi_R$ reveals whether 101L(x) = R(x) or $\pi_L \pi_O = \pi_R$ whether L(x) + O(x) = R(x).
- Therefore, the prover must add some "noise" to the proof, so that the verifier can't use the proof to extract any information about the witness. The randomness of prover is kept secret.
- Simultaneously, this noise would still make the same proof checkable by already defined verification equations.

Question

So how to we represent such "noise" with preserving "homomorphic" properties of the proof?

How do we fix that? Doing stuff

Idea #1

Let prover pick random values $\delta_R, \delta_O, \delta_L, \delta_H \xleftarrow{R} \mathbb{F}$ and calculate the "distorted" values:

$$\pi_L \leftarrow g^{L(\tau) + \delta_L}, \quad \pi_R \leftarrow g^{R(\tau) + \delta_R}, \quad \text{same for } \pi_O, \pi_H$$

How do we fix that? Doing stuff

Idea #1

Let prover pick random values $\delta_R, \delta_O, \delta_L, \delta_H \xleftarrow{R} \mathbb{F}$ and calculate the "distorted" values:

$$\pi_L \leftarrow g^{L(\tau) + \delta_L}, \quad \pi_R \leftarrow g^{R(\tau) + \delta_R}, \quad \text{same for } \pi_O, \pi_H$$

Problem (informally): To make previous verification mechanism work, δ_H must be picked "carefully". However, it's impossible to do so with this construction.

How do we fix that? Doing stuff

Idea #1

Let prover pick random values $\delta_R, \delta_O, \delta_L, \delta_H \xleftarrow{R} \mathbb{F}$ and calculate the "distorted" values:

$$\pi_L \leftarrow g^{L(\tau) + \delta_L}, \quad \pi_R \leftarrow g^{R(\tau) + \delta_R}, \quad \text{same for } \pi_O, \pi_H$$

Problem (informally): To make previous verification mechanism work, δ_H must be picked "carefully". However, it's impossible to do so with this construction.

Idea #2

Let prover pick random values $\delta_R, \delta_O, \delta_L \xleftarrow{R} \mathbb{F}$ and calculate:

$$\pi_L \leftarrow g^{L(\tau) + \delta_L Z(\tau)}, \quad \pi_R \leftarrow g^{R(\tau) + \delta_R Z(\tau)}, \quad \pi_O \leftarrow g^{O(\tau) + \delta_O Z(\tau)}$$

Recap

Making Idea Practical

This expression can be easily evaluated. For example,

$$\pi_L = g^{L(\tau)} \cdot \left(g^{Z(\tau)}\right)^{\delta_L} = \operatorname{com}(L) \cdot \operatorname{com}(Z)^{\delta_L}$$

Making Idea Practical

This expression can be easily evaluated. For example,

$$\pi_L = g^{L(\tau)} \cdot \left(g^{Z(\tau)}\right)^{\delta_L} = \operatorname{com}(L) \cdot \operatorname{com}(Z)^{\delta_L}$$

Problem

However, the verifier can't check the equation $e(\pi_L, \pi_R) = e(\text{com}(Z), \pi_H) \cdot e(\pi_O, g)$ anymore.

Making Idea Practical

This expression can be easily evaluated. For example,

$$\pi_L = g^{L(\tau)} \cdot \left(g^{Z(\tau)}\right)^{\delta_L} = \operatorname{com}(L) \cdot \operatorname{com}(Z)^{\delta_L}$$

Problem

However, the verifier can't check the equation $e(\pi_L, \pi_R) = e(\text{com}(Z), \pi_H) \cdot e(\pi_O, g)$ anymore.

Idea #3

Our "noise" must be controlled! This can be achieved by calculating π_H as $g^{H(\tau)+\Delta_H}$ where Δ_H depends on $\delta_L, \delta_R, \delta_O$ (and possibly other public parameters).

Recap

Check $e(\pi_L, \pi_R) = e(\text{com}(Z), \pi_H) \cdot e(\pi_O, g)$ is now equivalent to:

$$(L(x)+\delta_L Z(x))(R(x)+\delta_R Z(x))=(H(x)+\Delta_H)Z(x)+(O(x)+\delta_O Z(x)),$$

Making Idea Practical

Check $e(\pi_L, \pi_R) = e(\text{com}(Z), \pi_H) \cdot e(\pi_O, g)$ is now equivalent to:

$$(L(x)+\delta_L Z(x))(R(x)+\delta_R Z(x))=(H(x)+\Delta_H)Z(x)+(O(x)+\delta_O Z(x)),$$

which, by expanding, gives us the following equation:

$$L(x)R(x) + \delta_R L(x)Z(x) + \delta_L Z(x)R(x) + \delta_L \delta_R Z(x)^2$$

$$= \underline{H(x)Z(x)} + O(x) + \Delta_H Z(x) + \delta_O Z(x)$$

Making Idea Practical

Check $e(\pi_L, \pi_R) = e(\text{com}(Z), \pi_H) \cdot e(\pi_O, g)$ is now equivalent to:

$$(L(x)+\delta_L Z(x))(R(x)+\delta_R Z(x))=(H(x)+\Delta_H)Z(x)+(O(x)+\delta_O Z(x)),$$

which, by expanding, gives us the following equation:

$$L(x)R(x) + \delta_R L(x)Z(x) + \delta_L Z(x)R(x) + \delta_L \delta_R Z(x)^2$$

$$= \underline{H(x)Z(x)} + O(x) + \Delta_H Z(x) + \delta_O Z(x)$$

where we can cancel out L(x)R(x) and H(x)Z(x) + O(x) terms since they are equal based on initial construction. This way, we get the following expression for Δ_H :

$$\Delta_H = \delta_O + \delta_R L(x) + \delta_L R(x) + \delta_L \delta_R Z(x)$$

Recap

Finally, let us not forget about π_{β} ! Previously, we had:

$$\pi_{\beta} = g^{\beta_L L(\tau) + \beta_R R(\tau) + \beta_O O(\tau)}$$

Witness consistency proof

Finally, let us not forget about π_{β} ! Previously, we had:

$$\pi_{\beta} = g^{\beta_L L(\tau) + \beta_R R(\tau) + \beta_O O(\tau)}$$

Now, we change:

$$\blacktriangleright L(\tau) \mapsto L(\tau) + \delta_L Z(\tau)$$

$$ightharpoonup R(au) \mapsto R(au) + \delta_R Z(au)$$

$$ightharpoonup O(au) \mapsto O(au) + \delta_O Z(au)$$

Witness consistency proof

Finally, let us not forget about π_{β} ! Previously, we had:

$$\pi_{\beta} = g^{\beta_L L(\tau) + \beta_R R(\tau) + \beta_O O(\tau)}$$

Now, we change:

$$\blacktriangleright L(\tau) \mapsto L(\tau) + \delta_L Z(\tau)$$

$$ightharpoonup R(au) \mapsto R(au) + \delta_R Z(au)$$

$$ightharpoonup O(au) \mapsto O(au) + \delta_O Z(au)$$

Therefore, our new π_{β} becomes:

$$\pi_{\beta} = \left(g^{\beta_L Z(\tau)}\right)^{\delta_L} \left(g^{\beta_R Z(\tau)}\right)^{\delta_R} \left(g^{\beta_O Z(\tau)}\right)^{\delta_O} g^{\beta_L L(\tau) + \beta_R R(\tau) + \beta_O O(\tau)}$$

Verifier V

Real Protocols

Complexity of the Basic Protocol

Overall Complexity

Suppose circuit consists of n gates. Then, the complexity of the basic protocol is as follows:

- **Proof Size:** O(1) constant number of group elements.
- **Setup Time:** O(n) calculating powers of τ , evaluations at τ .
- Prover Time: $O(n \log n)$ using FFT and wise choice of Ω .
- Verifier Time: O(1) constant number of pairings. However, O(1) is not very descriptive for proof and verifier complexities, so let us provide a more detailed analysis.
- Proof Size: 9 G group elements.
- Verifier Time: 15 pairings.

We can do better!

Pinocchio Protocol

Idea

In toxic waste, include $\rho_L, \rho_R \xleftarrow{R} \mathbb{F}$, set $\rho_O \leftarrow \rho_L \rho_R$, and define the following generators:

$$g_L \leftarrow g^{\rho_L}, \quad g_R \leftarrow g^{\rho_R}, \quad g_O \leftarrow g^{\rho_O}$$

Reason

Such choice of generators reduce 15 pairings to **11 pairings**. Additionally, we have only **8 group elements** in the proof.

Recap

Idea: Generic Group Model

Use **Generic Group Model** (GGM) technique. Simply put, GGM allows the adversary to only make **oracle requests** to compute the group operations. For example, having a set $\{g^{\alpha R_i(\tau)}\}_{i\in[d]}$, adversary can compute only linear combinations of these values. In the particular case of Groth16, instead of considering $L_i(x)$, $R_i(x)$, and $O_i(x)$ separately, we construct their linear combinations as $Q_i(x) := \beta L_i(x) + \alpha R_i(x) + O_i(x)$, where α and β are toxic parameters.

Recap

The proving key is formed as follows:

$$\begin{aligned} \mathsf{pp} &\leftarrow \left(g_1^{\alpha}, g_1^{\beta}, g_1^{\delta}, \left\{ g_1^{\tau^i}, \frac{\beta L_i(\tau) + \alpha R_i(\tau) + O_i(\tau)}{\gamma}, \frac{\tau^i Z(\tau)}{\delta} \right\}_{i \in [n]}, \\ g_2^{\beta}, g_2^{\delta}, g_2^{\gamma}, \left\{ g_2^{\tau^i} \right\}_{i \in [d]} \right) \end{aligned}$$

Groth16 Protocol: Proving Procedure

Sample random $\delta_L, \delta_R \xleftarrow{R} \mathbb{F}$ and compute the following values:

$$\pi_{L} \leftarrow g_{1}^{\alpha + \sum_{i=1}^{n} w_{i}L_{i}(\tau) + \delta_{L}\delta}, \quad \pi_{R} \leftarrow g_{2}^{\beta + \sum_{i=0}^{n} w_{i}R_{i}(\tau) + \delta_{R}\delta},$$
$$\pi_{O} \leftarrow g_{1}^{\frac{Q_{\text{mid}}(\tau) + H(\tau)Z(\tau)}{\delta} + L\delta_{R} + R\delta_{L} - \delta_{L}\delta_{R}\delta},$$

where by Q_{mid} we denoted the following expression:

$$Q_{\mathsf{mid}}(\tau) = \sum_{i \in \mathcal{I}_{\mathsf{mid}}} w_i Q_i(\tau) = \sum_{i \in \mathcal{I}_{\mathsf{mid}}} w_i (\beta L_i(\tau) + \alpha R_i(\tau) + O_i(\tau))$$

Groth16 Protocol: Verification Procedure

The verifier first calculates the following value:

$$\pi_{\mathsf{io}} \leftarrow g_1^{\sum_{i \in \mathcal{I}_{\mathsf{io}}} w_i (\beta L_i(\tau) + \alpha R_i(\tau) + O_i(\tau)) / \gamma},$$

and then checks the following single condition:

$$e(\pi_L, \pi_R) = e(g_1^{\alpha}, g_2^{\beta}) e(\pi_{io}, g_2^{\gamma}) e(\pi_O, g_2^{\delta})$$

Note

Recap

 $e(g_1^{\alpha},g_2^{\beta})$ can be additionally hard-coded in the verifier, thus reducing the number of pairings to 3. Finally, the proof's size is now reduced to 3 group elements: two from \mathbb{G}_1 , and one from \mathbb{G}_2 .
