## Plan

- What is zk-SNARK?
- 2 Boolean Circuits
- Arithmetic Circuits
- 4 Linear Algebruh Preliminaries
- 5 Rank-1 Constraint System

Distributed Lab zk-SNARK I 2 / 43 Sep 12, 2024 2 / 43

Distributed Lab zk-SNARK I 3 / 43 Sep 12, 2024 3 / 43

### **Definition**

**zk-SNARK** – Zero-Knowledge Succinct Non-interactive ARgument of Knowledge.

### **Definition**

**zk-SNARK** – Zero-Knowledge Succinct Non-interactive ARgument of Knowledge.

 Argument of Knowledge — a proof that the prover knows the data (witness) that resolves a certain problem, and this knowledge can be "extracted".

### **Definition**

**zk-SNARK** – Zero-Knowledge Succinct Non-interactive ARgument of Knowledge.

- Argument of Knowledge a proof that the prover knows the data (witness) that resolves a certain problem, and this knowledge can be "extracted".
- Succinctness the proof size and verification time is relatively small to the computation size and typically does not depend on the size of the data or statement.

4 / 43

### **Definition**

**zk-SNARK** – Zero-Knowledge Succinct Non-interactive ARgument of Knowledge.

- Argument of Knowledge a proof that the prover knows the data (witness) that resolves a certain problem, and this knowledge can be "extracted".
- Succinctness the proof size and verification time is relatively small to the computation size and typically does not depend on the size of the data or statement.
- Non-interactiveness to produce the proof, the prover does not need any interaction with the verifier.

Well... Let's take a look at some example.

Distributed Lab zk-SNARK I 5 / 43 Sep 12, 2024 5 / 43

Well... Let's take a look at some example.

Imagine you're part of a treasure hunt...

Well... Let's take a look at some example.

Imagine you're part of a treasure hunt...

...and you've found a hidden treasure chest...

5 / 43

Well... Let's take a look at some example.

Imagine you're part of a treasure hunt...

...and you've found a hidden treasure chest...

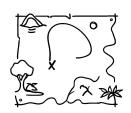

...but how to prove that without revealing the chest location?

**The Problem**: you have found a hidden treasure chest, and you want to prove to the organizer that you know its location without actually revealing that.

**The Problem**: you have found a hidden treasure chest, and you want to prove to the organizer that you know its location without actually revealing that.

We can retrieve some information from that:

**The Secret Data**: the exact treasure location.

The Prover: you.

The Verifier: the treasure hunt organizer.

6/43

Distributed Lab zk-SNARK I 6 / 43 Sep 12, 2024

Here is how we can apply the zk-SNARK to our problem:

 Argument of Knowledge: You need to create a proof that demonstrates you know the chest is.

Distributed Lab zk-SNARK I 7/43 Sep 12, 2024 7/43

Here is how we can apply the zk-SNARK to our problem:

- Argument of Knowledge: You need to create a proof that demonstrates you know the chest is.
- Succinct: The proof you provide is very small and concise. It doesn't
  matter how large the treasure map is or how many steps it took you
  to find the chest.

Here is how we can apply the zk-SNARK to our problem:

- Argument of Knowledge: You need to create a proof that demonstrates you know the chest is.
- Succinct: The proof you provide is very small and concise. It doesn't
  matter how large the treasure map is or how many steps it took you
  to find the chest.
- Non-interactive: You don't need to have a back-and-forth conversation with the organizer to create this proof.

- Zero-Knowledge: The proof doesn't reveal any information about the actual location of the treasure chest.

Well... The golden coin where the pirates' sign is engraved is our zk-SNARK proof!

## The First Question To Resolve

But the problems that we usually want to solve are in a slightly different format.

## The First Question To Resolve

But the problems that we usually want to solve are in a slightly different format.

When we need to prove that some element is in a merkle tree, we can't come to a verifier and give them a "coin"...

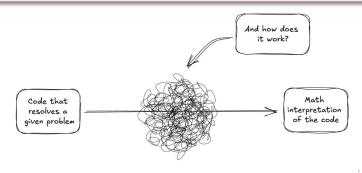

## The First Question To Resolve

But the problems that we usually want to solve are in a slightly different format.

When we need to prove that some element is in a merkle tree, we can't come to a verifier and give them a "coin"...

### Question?

How do we convert a program into a mathematical language?

## **Boolean Circuits**

Distributed Lab zk-SNARK I 9/43 Sep 12, 2024 9/43

### **Boolean Circuits**

We can do that in a way like the computer does it - boolean circuits.

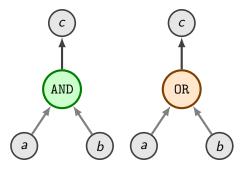

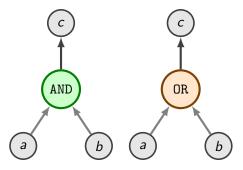

Figure: Boolean AND and OR Gates

### **Boolean Circuits**

We can do that in a way like the computer does it - boolean circuits.

Α	В	A AND B	
0	0	0	
0	1	0	
1	0	0	
1	1	1	

Figure: AND Gate Truth Table

Figure: Boolean AND and OR Gates

#### Note

With any of  $\{AND, NOT\}$  or  $\{OR, NOT\}$  gates sets one can build any possible logical circuit, they are called **functionally complete** sets.

# Boolean Circuit Example

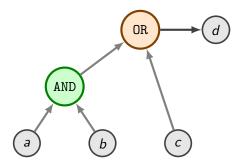

Figure: Example of a circuit evaluating d = (a AND b) OR c.

Distributed Lab zk-SNARK I 11 / 43 Sep 12, 2024 11 / 43

# Boolean Circuit Example

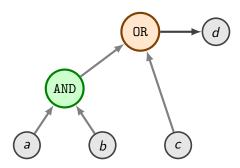

Figure: Example of a circuit evaluating d = (a AND b) OR c.

Boolean circuits receive an input vector of 0, 1 and resolve to true (1) or false (0);

The above circuit can be satisfied with the next values:

$$a = 1, \quad b = 1, \quad c = 0, \quad d = 1$$

Distributed Lab zk-SNARK I 11 / 43 Sep 12, 2024

### SHA-256 Boolean circuit

File	No. ANDs	No. XORs	No. INVs
sha256Final.txt	22,272	91,780	2,194

Figure: Stats of a SHA256 boolean circuit implementation.

More than 100000 gates. Impressive, doesn't it?

But it also shows how inconvenient the boolean circuits are.

# **Arithmetic Circuits**

Distributed Lab zk-SNARK I 13 / 43 Sep 12, 2024 13 / 43

### Arithmetic Circuits

Similar to Boolean Circuits, the **Arithmetic circuits** consist of gates and wires.

- ullet Wires: elements of some finite field  $\mathbb{F}$ .
- ullet Gates: addition  $(\oplus)$  and multiplication  $(\odot)$  corresponding to the field.

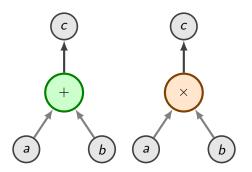

Figure: Addition and Multiplication Gates

# Example

```
def multiply(a: F, b: F) -> F:
    return a * b
```

15 / 43

## Example

```
def multiply(a: F, b: F) -> F:
    return a * b
```

This can be represented as a circuit with only one (multiplication) gate:

$$r = a \times b$$

Distributed Lab zk-SNARK I 15 / 43 Sep 12, 2024 15 / 43

## Example

```
def multiply(a: F, b: F) -> F:
    return a * b
```

This can be represented as a circuit with only one (multiplication) gate:

$$r = a \times b$$

The witness vector (essentially, our solution vector) is  $\mathbf{w} = (r, a, b)$ , for example: (6, 2, 3).

We assume that the *a* and *b* are input values.

15/43

Distributed Lab zk-SNARK I 15 / 43 Sep 12, 2024

### Example

```
def multiply(a: F, b: F) -> F:
    return a * b
```

This can be represented as a circuit with only one (multiplication) gate:

$$r = a \times b$$

The witness vector (essentially, our solution vector) is  $\mathbf{w} = (r, a, b)$ , for example: (6, 2, 3).

We assume that the *a* and *b* are input values.

### Note

We can think of the = in the gate as an assertion.

◆□▶★御▶★恵▶★恵▶ 恵 めのの

### Example

Now, suppose we want to implement the evaluation of the polynomial  $Q(x_1, x_2) = x_1^3 + x_2^2 \in \mathbb{F}[x_1, x_2]$  using arithmetic circuits.

Looks easy, right? But the circuit is now much less trivial.

$$x_1^2 = x_1 \times x_1$$
  $r_1 = x_1 \times x_1$   
 $x_1^3 = x_1^2 \times x_1$  or  $r_2 = r_1 \times x_1$   
 $x_2^2 = x_2 \times x_2$  or  $r_3 = x_2 \times x_2$   
 $Q = x_1^3 + x_2^2$   $Q = r_2 + r_3$ 

16 / 43

Distributed Lab zk-SNARK I 16 / 43 Sep 12, 2024

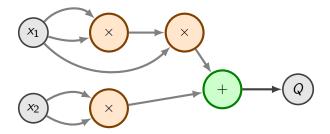

Figure: Example of a circuit evaluating  $x_1^3 + x_2^2$ .

Distributed Lab zk-SNARK I 17 / 43 Sep 12, 2024 17 / 43

### Example

Well, it is quite clear how to represent any polynomial-like expressions. But how can we translate if statements?

```
def example(a: bool, b: F, c: F) -> F:
    if a:
        return b * c
    else:
        return b + c
```

### Example

Well, it is quite clear how to represent any polynomial-like expressions. But how can we translate if statements?

```
def example(a: bool, b: F, c: F) -> F:
    if a:
        return b * c
    else:
        return b + c
```

We can transform such a function into the next expression:

$$r = a \times (b \times c) + (1 - a) \times (b + c)$$

18 / 43

### Example

Well, it is quite clear how to represent any polynomial-like expressions. But how can we translate if statements?

```
def example(a: bool, b: F, c: F) -> F:
    if a:
        return b * c
    else:
        return b + c
```

We can transform such a function into the next expression:

$$r = a \times (b \times c) + (1 - a) \times (b + c)$$

Corresponding equations for the circuit are:

$$r_1 = b \times c,$$
  $r_3 = 1 - a,$   $r_5 = r_3 \times r_2$   
 $r_2 = b + c,$   $r_4 = a \times r_1,$   $r = r_4 + r_5$

# Circuit Satisfability Problem

#### **Definition**

Arithmetic circuit  $C: \mathbb{F}^N \to \mathbb{F}$  over a finite field  $\mathbb{F}$  is a directed acyclic graph where internal nodes are labeled via +, -, and  $\times$ , and inputs are labeled  $1, x_1, x_2, \ldots, x_n$ . By |C| we denote the number of gates in the circuit.

# Circuit Satisfability Problem

#### Definition

Arithmetic circuit  $C: \mathbb{F}^N \to \mathbb{F}$  over a finite field  $\mathbb{F}$  is a directed acyclic graph where internal nodes are labeled via +, -, and  $\times$ , and inputs are labeled  $1, x_1, x_2, \ldots, x_n$ . By |C| we denote the number of gates in the circuit.

#### **Definition**

The **Circuit Satisfiability Problem** is defined as follows: given an arithmetic circuit C and a public input  $x \in \mathbb{F}^n$ , determine if there exists a private input  $w \in \mathbb{F}^m$  such that C(x,w)=0. More formally, the problem is determined by relation  $\mathcal{R}_{\mathbb{C}}$  and corresponding language  $\mathcal{L}_{\mathbb{C}}$  as follows:

$$\mathcal{R}_{C} = \{(x, w) \in \mathbb{F}^{n} \times \mathbb{F}^{m} \mid C(x, w) = 0\},\$$
  
$$\mathcal{L}_{C} = \{x \in \mathbb{F}^{n} \mid \exists w \in \mathbb{F}^{m} : C(x, w) = 0\}$$

# Linear Algebruh Preliminaries

Distributed Lab zk-SNARK I 21 / 43 Sep 12, 2024 21 / 43

# Vector Space

#### Definition

A **vector space** V over the field  $\mathbb{F}$  is an abelian group for addition "+" together with a scalar multiplication operation " $\cdot$ " from  $\mathbb{F} \times V$  to V, sending  $(\lambda, x) \mapsto \lambda x$  and such that for any  $\mathbf{v}, \mathbf{u} \in V$  and  $\lambda, \mu \in \mathbb{F}$  we have:

- $\lambda(\mathbf{u} + \mathbf{v}) = \lambda \mathbf{u} + \lambda \mathbf{v}$
- $(\lambda + \mu)\mathbf{v} = \lambda\mathbf{v} + \mu\mathbf{v}$
- $(\lambda \mu)\mathbf{v} = \lambda(\mu \mathbf{v})$
- 1v = v

Any element  $\mathbf{v} \in V$  is called a **vector**, and any element  $\lambda \in \mathbb{F}$  is called a scalar. We also mark vector elements in boldface.

Sep 12, 2024

### Matrix

The matrix is a rectangular array of numbers, symbols, or expressions, arranged in rows and columns. For example, the matrix A with m rows and n columns, consisting of elements from the finite field  $\mathbb F$  is denoted as  $A \in \mathbb F^{m \times n}$ .

#### **Definition**

Let A, B be two matrices over the field  $\mathbb{F}$ . The following operations are defined:

- Matrix addition/subtraction:  $A \pm B = \{a_{i,j} \pm b_{i,j}\}_{i,j=1}^{m \times n}$ . The matrices A and B must have the same size  $m \times n$ .
- Scalar multiplication:  $\lambda A = \{\lambda a_{i,j}\}_{1 \leq i,j \leq n}$  for any  $\lambda \in \mathbb{F}$ .
- Matrix multiplication: C = AB is a matrix  $C \in \mathbb{F}^{m \times p}$  with elements  $c_{i,j} = \sum_{\ell=1}^n a_{i,\ell} b_{\ell,j}$ . The number of columns in A must be equal to the number of rows in B, that is  $A \in \mathbb{F}^{m \times n}$  and  $B \in \mathbb{F}^{n \times p}$ .

Distributed Lab zk-SNARK I 23 / 43 Sep 12, 2024 23 / 43

# Matrix Multiplication

### Example

Consider

$$A = \begin{bmatrix} 1 & 1 & 2 \\ 2 & 2 & 1 \end{bmatrix} \in \mathbb{R}^{2 \times 3}, \quad B = \begin{bmatrix} 2 & 1 \\ 1 & 3 \\ 1 & 1 \end{bmatrix} \in \mathbb{R}^{3 \times 2}$$

We cannot add A and B since they have different sizes. However, we can multiply them:

$$AB = \begin{bmatrix} 5 & 6 \\ 7 & 9 \end{bmatrix}, \quad BA = \begin{bmatrix} 4 & 4 & 5 \\ 7 & 7 & 5 \\ 3 & 3 & 3 \end{bmatrix}$$

To see why, for example, the upper left element of AB is 5, we can calculate it as  $\sum_{\ell=1}^3 a_{1,\ell} b_{\ell,1} = 1 \times 2 + 1 \times 1 + 2 \times 1 = 5$ .

- (ロ) (個) (量) (量) (量) (2) (2)

Distributed Lab zk-SNARK I

### Vector As A Matrix

#### Note

It just so happens that when working with vectors, we usually assume that they are **column vectors**. This means that the vector  $v = (v_1, v_2, \dots, v_n)$  is represented as a matrix:

$$\mathbf{v} = egin{bmatrix} v_1 \ v_2 \ dots \ v_n \end{bmatrix}$$

This is a common convention in linear algebra, and we will use it in the following sections.

Distributed Lab zk-SNARK I 25 / 43 Sep 12, 2024 25 / 43

# Matrix Transpose

### Definition (Transposition)

Given a matrix  $A \in \mathbb{F}^{m \times n}$ , the **transpose** of A is a matrix  $A^{\top} \in \mathbb{F}^{n \times m}$  with elements  $A_{ii}^{\top} = A_{ji}$ .

### Example

$$A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}, \quad A^{\top} = \begin{bmatrix} 1 & 3 \\ 2 & 4 \end{bmatrix}$$
$$B = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}, \quad B^{\top} = \begin{bmatrix} 1 & 4 \\ 2 & 5 \\ 3 & 6 \end{bmatrix}$$

 $\mathbf{v} = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix}, \quad \mathbf{v}^{\top} = [1, 2, 3]$ 

### Inner Product

#### **Definition**

Consider the vector space  $\mathbb V$  over the finite field  $\mathbb F_p$ . The **inner product** is a function  $\langle \cdot, \cdot \rangle : \mathbb V \times \mathbb V \to \mathbb F_p$  satisfying the following conditions for all  $\mathbf u, \mathbf v, \mathbf w \in \mathbb V$ :

- $\langle \mathbf{u} + \mathbf{v}, \mathbf{w} \rangle = \langle \mathbf{u}, \mathbf{w} \rangle + \langle \mathbf{v}, \mathbf{w} \rangle$ .
- $\langle \mathbf{u}, \mathbf{v} \rangle = 0$  for all  $\mathbf{u} \in \mathbb{V}$  iff  $\mathbf{v} = \mathbf{0}$ .
- $\langle \mathbf{u}, \mathbf{v} \rangle = 0$  for all  $\mathbf{v} \in \mathbb{V}$  iff  $\mathbf{u} = \mathbf{0}$ .

Plenty of functions can be built that satisfy the inner product definition, we'll use the one that is usually called **dot product**.

Distributed Lab zk-SNARK I 27 / 43 Sep 12, 2024 27 / 43

### **Dot Product**

#### **Definition**

Consider the vector space  $\mathbb V$  over the finite field  $\mathbb F_p$ . The **dot product** on  $\mathbb V$  is a function  $\langle \cdot, \cdot \rangle : \mathbb V \times \mathbb V \to \mathbb F$ , defined for every  $\mathbf u, \mathbf v \in \mathbb V$  as follows:

$$\langle \mathbf{u}, \mathbf{v} \rangle := \mathbf{u}^{\top} \mathbf{v} = \sum_{i=1}^{n} u_{i} v_{i}$$

Distributed Lab zk-SNARK I 28 / 43 Sep 12, 2024 28 / 43

### Dot Product

#### Definition

Consider the vector space  $\mathbb{V}$  over the finite field  $\mathbb{F}_p$ . The **dot product** on  $\mathbb{V}$  is a function  $\langle \cdot, \cdot \rangle : \mathbb{V} \times \mathbb{V} \to \mathbb{F}$ , defined for every  $\mathbf{u}, \mathbf{v} \in \mathbb{V}$  as follows:

$$\langle \mathbf{u}, \mathbf{v} \rangle := \mathbf{u}^{\top} \mathbf{v} = \sum_{i=1}^{n} u_{i} v_{i}$$

#### Note

The dot product can also be denoted using the dot notation as:

$$\mathbf{u} \cdot \mathbf{v}$$

That is why it's called the "dot" product.

28 / 43

Distributed Lab zk-SNARK I 28 / 43

### **Dot Product**

### Example

Let  $\mathbf{u}, \mathbf{v}$  are vectors over the real number  $\mathbb{R}$ , where

$$\mathbf{u} = (1, 2, 3), \quad \mathbf{v} = (2, 4, 3)$$

Then:

$$\langle \mathbf{u}, \mathbf{v} \rangle = \sum_{i=1}^{3} u_i v_i = 2 \cdot 1 + 2 \cdot 4 + 3 \cdot 3 = 2 + 8 + 9 = 19$$

Distributed Lab zk-SNARK I 29 / 43 Sep 12, 2024 29 / 43

### Hadamard Product

#### **Definition**

Suppose  $A, B \in \mathbb{F}^{m \times n}$ . The **Hadamard product**  $A \odot B$  gives a matrix C such that  $C_{i,j} = A_{i,j}B_{i,j}$ . Essentially, we multiply elements elementwise.

### Example

Consider 
$$A = \begin{bmatrix} 1 & 1 & 2 \\ 3 & 0 & 3 \end{bmatrix}$$
,  $B = \begin{bmatrix} 3 & 2 & 1 \\ 0 & 2 & 1 \end{bmatrix}$ . Then, the Hadamard product:

$$A \odot B = \begin{bmatrix} 1 \cdot 3 & 1 \cdot 2 & 2 \cdot 1 \\ 3 \cdot 0 & 0 \cdot 2 & 3 \cdot 1 \end{bmatrix} = \begin{bmatrix} 3 & 2 & 2 \\ 0 & 0 & 3 \end{bmatrix}$$

Distributed Lab zk-SNARK I 31 / 43 Sep 12, 2024 31 / 43

### Lemma (Properties of outer product)

For any scalar  $c \in \mathbb{F}$  and  $(\mathbf{u}, \mathbf{v}, \mathbf{w}) \in \mathbb{F}^n \times \mathbb{F}^m \times \mathbb{F}^p$ :

- Transpose:  $(\mathbf{u} \otimes \mathbf{v}) = (\mathbf{v} \otimes \mathbf{u})^T$
- Distributivity:  $\mathbf{u} \otimes (\mathbf{v} + \mathbf{w}) = \mathbf{u} \otimes \mathbf{v} + \mathbf{u} \otimes \mathbf{w}$
- Scalar Multiplication:  $c(\mathbf{v} \otimes \mathbf{u}) = (c\mathbf{v}) \otimes \mathbf{u} = \mathbf{v} \otimes (c\mathbf{u})$
- Rank: the outer product  $\mathbf{u} \otimes \mathbf{v}$  is a rank-1 matrix if  $\mathbf{u}$  and  $\mathbf{v}$  are non-zero vectors

Distributed Lab zk-SNARK I 32 / 43 Sep 12, 2024 32 / 43

#### Example

Let  $\mathbf{u}, \mathbf{v}$  are vectors over the real number  $\mathbb{R}$ , where

$$\mathbf{u} = (1, 2, 3), \quad \mathbf{v} = (2, 4, 3)$$

Then:

$$\mathbf{u} \otimes \mathbf{v} = \mathbf{u} \mathbf{v}^{\top} = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} \begin{bmatrix} 2 & 4 & 3 \end{bmatrix} = \begin{bmatrix} 1 \cdot 2 & 1 \cdot 4 & 1 \cdot 3 \\ 2 \cdot 2 & 2 \cdot 4 & 2 \cdot 3 \\ 3 \cdot 2 & 3 \cdot 4 & 3 \cdot 3 \end{bmatrix} = \begin{bmatrix} 2 & 4 & 3 \\ 4 & 8 & 6 \\ 6 & 12 & 9 \end{bmatrix}$$

Distributed Lab zk-SNARK I 33 / 43 Sep 12, 2024 33 / 43

### Example

Let  $\mathbf{u}, \mathbf{v}$  are vectors over the real number  $\mathbb{R}$ , where

$$\mathbf{u} = (1, 2, 3), \quad \mathbf{v} = (2, 4, 3)$$

Then:

$$\mathbf{u} \otimes \mathbf{v} = \mathbf{u} \mathbf{v}^{\top} = \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} \begin{bmatrix} 2 & 4 & 3 \end{bmatrix} = \begin{bmatrix} 1 \cdot 2 & 1 \cdot 4 & 1 \cdot 3 \\ 2 \cdot 2 & 2 \cdot 4 & 2 \cdot 3 \\ 3 \cdot 2 & 3 \cdot 4 & 3 \cdot 3 \end{bmatrix} = \begin{bmatrix} 2 & 4 & 3 \\ 4 & 8 & 6 \\ 6 & 12 & 9 \end{bmatrix}$$

The rows/columns number 2 and 3 in the result matrix can be represented as a linear combination of the first row/column, specifically by multiplying it by 2 and 3, respectively.

# Rank-1 Constraint System

Distributed Lab zk-SNARK I 34 / 43 Sep 12, 2024 34 / 43

### Constraint Definition

#### **Definition**

Each constraint in the Rank-1 Constraint System must be in the form:

$$\langle \mathbf{a}, \mathbf{w} \rangle \times \langle \mathbf{b}, \mathbf{w} \rangle = \langle \mathbf{c}, \mathbf{w} \rangle$$

Where  $\mathbf{w}$  is a vector containing all the *input*, *output*, and *intermediate* variables involved in the computation. The vectors  $\mathbf{a}$ ,  $\mathbf{b}$ , and  $\mathbf{c}$  are vectors of coefficients corresponding to these variables, and they define the relationship between the linear combinations of  $\mathbf{w}$  on the left-hand side and the right-hand side of the equation.

Distributed Lab zk-SNARK I 35 / 43 Sep 12, 2024 35 / 43

# Constraint Example

### Example

Consider the most basic circuit with one multiplication gate:

$$r = x_1 \times x_2$$

Since we have 3 variables, the constraint is written as:

$$(a_1w_1 + a_2w_2 + a_3w_3)(b_1w_1 + b_2w_2 + b_3w_3) = c_1w_1 + c_2w_2 + c_3w_3$$

Coefficients and witness vectors are:

$$\mathbf{w} = (r, x_1, x_2), \quad \mathbf{a} = (0, 1, 0), \quad \mathbf{b} = (0, 0, 1), \quad \mathbf{c} = (1, 0, 0).$$

Therefore, our expression above reduces to:

$$(0w_1 + 1w_2 + 0w_3)(0w_1 + 0w_2 + 1w_3) = (1w_1 + 0w_2 + 0w_3)$$
  
 $w_2 \times w_3 = w_1$   
 $x_1 \times x_2 = r$ 

Now, let us consider a more complex example.

def r(x1: bool, x2: F, x3: F) 
$$\rightarrow$$
 F:  
return x2 \* x3 if x1 else x2 + x3

That can be expressed as:

$$r = x_1 \times (x_2 \times x_3) + (1 - x_1) \times (x_2 + x_3)$$

Distributed Lab zk-SNARK I 37 / 43 Sep 12, 2024 37 / 43

Now, let us consider a more complex example.

def r(x1: bool, x2: F, x3: F) 
$$\rightarrow$$
 F:  
return x2 \* x3 if x1 else x2 + x3

That can be expressed as:

$$r = x_1 \times (x_2 \times x_3) + (1 - x_1) \times (x_2 + x_3)$$

We need a boolean restriction for  $x_1$ :

$$x_1\times (1-x_1)=0$$

Distributed Lab zk-SNARK I 37 / 43 Sep 12, 2024 37 / 43

Now, let us consider a more complex example.

def r(x1: bool, x2: F, x3: F) 
$$\rightarrow$$
 F:  
return x2 \* x3 if x1 else x2 + x3

That can be expressed as:

$$r = x_1 \times (x_2 \times x_3) + (1 - x_1) \times (x_2 + x_3)$$

We need a boolean restriction for  $x_1$ :

$$x_1\times (1-x_1)=0$$

Thus, the next constraints can be build:

$$x_1 \times x_1 = x_1$$
 (binary check) (1)

$$x_2 \times x_3 = \text{mult}$$
 (2)

$$x_1 \times \text{mult} = \text{selectMult}$$
 (3)

$$(1-x_1)\times(x_2+x_3)=r-\mathsf{selectMult} \tag{4}$$

The witness vector:  $\mathbf{w} = (1, r, x_1, x_2, x_3, \text{mult}, \text{selectMult}).$ 

The coefficients vectors:

$$\begin{aligned} \mathbf{a}_1 &= (0,0,1,0,0,0,0), & \mathbf{b}_1 &= (0,0,1,0,0,0,0), & \mathbf{c}_1 &= (0,0,1,0,0,0,0) \\ \mathbf{a}_2 &= (0,0,0,1,0,0,0), & \mathbf{b}_2 &= (0,0,0,0,1,0,0), & \mathbf{c}_2 &= (0,0,0,0,0,1,0) \\ \mathbf{a}_3 &= (0,0,1,0,0,0,0), & \mathbf{b}_3 &= (0,0,0,0,0,1,0), & \mathbf{c}_3 &= (0,0,0,0,0,0,1) \end{aligned}$$

$$\mathbf{a}_4 = (1, 0, -1, 0, 0, 0, 0), \quad \mathbf{b}_4 = (0, 0, 0, 1, 1, 0, 0), \quad \mathbf{c}_4 = (0, 1, 0, 0, 0, 0, -1)$$

Using the arithmetic in a large finite field  $\mathbb{F}_p$ , consider the following values:

$$x_1 = 1, \quad x_2 = 3, \quad x_3 = 4$$

Verifying the constraints:

② 
$$x_2 \times x_3 = \text{mult} \quad (3 \times 4 = 12)$$

**1** 
$$(1-x_1) \times (x_2+x_3) = r - \text{selectMult}$$
  $(0 \times 7 = 12 - 12)$

### R1CS In Matrix Form

#### **Theorem**

Consider a Rank-1 Constraint System (R1CS) defined by m constraints. Each constraint is associated with coefficient vectors  $\mathbf{a}_i$ ,  $\mathbf{b}_i$ , and  $\mathbf{c}_i$ , where  $i \in \{1,2,\ldots,m\}$  and also a witness vector  $\mathbf{w}$  consisting of n elements. Then this system can also be represented using the corresponding matrices A, B, and C.

$$A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix} \quad B = \begin{bmatrix} b_{11} & b_{12} & \dots & b_{1n} \\ b_{21} & b_{22} & \dots & b_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ b_{m1} & b_{m2} & \dots & b_{mn} \end{bmatrix} \quad C = \begin{bmatrix} c_{11} & c_{12} & \dots & c_{1n} \\ c_{21} & c_{22} & \dots & c_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ c_{m1} & c_{m2} & \dots & c_{mn} \end{bmatrix}$$

such that all constraints can be reduced to the single equation:

$$A\mathbf{w} \odot B\mathbf{w} = C\mathbf{w}$$

◆ロト ◆問 ト ◆ 意 ト ◆ 意 ・ 夕 Q (\*)

### R1CS In Matrix Form

**Proof.** Matrices defined this way can be expressed as

$$A = \begin{bmatrix} \mathbf{a}_{1}^{\top} \\ \mathbf{a}_{2}^{\top} \\ \vdots \\ \mathbf{a}_{m}^{\top} \end{bmatrix}, \quad B = \begin{bmatrix} \mathbf{b}_{1}^{\top} \\ \mathbf{b}_{2}^{\top} \\ \vdots \\ \mathbf{b}_{m}^{\top} \end{bmatrix}, \quad C = \begin{bmatrix} \mathbf{c}_{1}^{\top} \\ \mathbf{c}_{2}^{\top} \\ \vdots \\ \mathbf{c}_{m}^{\top} \end{bmatrix}$$

Consider an expression Aw:

$$A\mathbf{w} = \begin{bmatrix} \mathbf{a}_1^\top \\ \mathbf{a}_2^\top \\ \vdots \\ \vdots \\ \mathbf{a}_m^\top \end{bmatrix} \begin{bmatrix} w_1 \\ w_2 \\ \vdots \\ w_n \end{bmatrix} = \begin{bmatrix} \mathbf{a}_1^\top \mathbf{w} \\ \mathbf{a}_2^\top \mathbf{w} \\ \vdots \\ \mathbf{a}_m^\top \mathbf{w} \end{bmatrix}$$

Therefore, we have:

$$A\mathbf{w} = \begin{bmatrix} \langle \mathbf{a}_1, \mathbf{w} \rangle \\ \langle \mathbf{a}_2, \mathbf{w} \rangle \\ \vdots \\ \langle \mathbf{a}_m, \mathbf{w} \rangle \end{bmatrix}, \quad B\mathbf{w} = \begin{bmatrix} \langle \mathbf{b}_1, \mathbf{w} \rangle \\ \langle \mathbf{b}_2, \mathbf{w} \rangle \\ \vdots \\ \langle \mathbf{b}_m, \mathbf{w} \rangle \end{bmatrix}, \quad C\mathbf{w} = \begin{bmatrix} \langle \mathbf{c}_1, \mathbf{w} \rangle \\ \langle \mathbf{c}_2, \mathbf{w} \rangle \\ \vdots \\ \langle \mathbf{c}_m, \mathbf{w} \rangle \end{bmatrix}$$

Thus,  $A\mathbf{w} \odot B\mathbf{w} = C\mathbf{w}$  is equivalent to the system of m constraints:

$$\langle \mathbf{a}_j, \mathbf{w} \rangle \times \langle \mathbf{b}_j, \mathbf{w} \rangle = \langle \mathbf{c}_j, \mathbf{w} \rangle, j \in \{1, \dots, m\}.$$

### R1CS In Matrix Form

### Example

The vectors  $\mathbf{a}_i$  from the previous examples have the form:

$$\begin{aligned} & \mathbf{a}_1 = (0,0,1,0,0,0,0) \\ & \mathbf{a}_2 = (0,0,0,1,0,0,0) \\ & \mathbf{a}_3 = (0,0,1,0,0,0,0) \\ & \mathbf{a}_4 = (1,0,-1,0,0,0,0) \end{aligned}$$

This corresponds to n = 7, m = 4

$$A = \begin{bmatrix} a_{1,1} & a_{1,2} & a_{1,3} & a_{1,4} & a_{1,5} & a_{1,6} & a_{1,7} \\ a_{2,1} & a_{2,2} & a_{2,3} & a_{2,4} & a_{2,5} & a_{2,6} & a_{2,7} \\ a_{3,1} & a_{3,2} & a_{3,3} & a_{3,4} & a_{3,5} & a_{3,6} & a_{3,7} \\ a_{4,1} & a_{4,2} & a_{4,3} & a_{4,4} & a_{4,5} & a_{4,6} & a_{4,7} \end{bmatrix} = \begin{bmatrix} 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 1 & 0 & -1 & 0 & 0 & 0 & 0 \end{bmatrix}$$

# Why Rank-1?

#### Lemma

Suppose we have a constraint  $\langle \mathbf{a}, \mathbf{w} \rangle \times \langle \mathbf{b}, \mathbf{w} \rangle = \langle \mathbf{c}, \mathbf{w} \rangle$  with coefficient vectors  $\mathbf{a}$ ,  $\mathbf{b}$ ,  $\mathbf{c}$  and witness vector  $\mathbf{w}$  (all from  $\mathbb{F}^n$ ). Then it can be expressed in the form:

 $\mathbf{w}^{\top}A\mathbf{w} + \mathbf{c}^{\top}\mathbf{w} = 0$ 

Where A is the outer product of vectors a, b, so a rank-1 matrix.

**Lemma proof.** Consider  $\mathbf{a}, \mathbf{b}, \mathbf{c}, \mathbf{w} \in \mathbb{F}^n$ .

$$\left(\sum_{i=1}^n a_i w_i\right) \times \left(\sum_{j=1}^n b_j w_j\right) = \sum_{k=1}^n c_k w_k$$

Combine the products into a double sum on the left side:

$$\sum_{i=1}^n \sum_{j=1}^n a_i b_j w_i w_j = \mathbf{w}^\top (\mathbf{a} \otimes \mathbf{b}) \mathbf{w} = \mathbf{w}^\top A \mathbf{w}$$

Thus, the constraint can be written as:

$$\mathbf{w}^{\mathsf{T}}A\mathbf{w} + \mathbf{c}^{\mathsf{T}}\mathbf{w} = 0$$
